No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                      437

Screening a culture of Paenibacillus isolate for Cry protein or toxin complex protein, useful for controlling lepidopterans, comprises obtaining DNA or protein from the culture and assaying the presence of the gene or protein.

Example 11; Page 70; 220pp; English.

The invention relates to a novel method for screening a culture of a Paenibacillus isolate for a gene encoding a protein selected from a Cry protein that is toxic to a lepidopteran pest and a toxin complex protein. The method comprises obtaining DNA from the culture and assaying the DNA for the presence of the gene or obtaining a protein produced by the culture and assaying the presence of a protein that indicates the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a method of identifying a subject at risk for the development of cancer, predicting progression or metastasis of non-small cell carcinoma and other carcinoma in a subject, or identifying an individual to be segregated from a high risk environment. The method comprises contacting an RPL14, CD313, PMGM, or GC20 gene probe with a test sample obtained from a subject, and analysing DNA from the test sample. The method is useful for identifying a subject (a smoker, non-
               Insecticide applications and may be useful for screening Paenibacillus sp. for toxin complex (TC)-like genes and proteins which may themselves be used to enhance or potentiate the activity of a stand-alone xenorhabdus toxin protein. The method may also be useful for screening Paenibacillus sp. and others for insecticidal thiaminase genes and proteins for controlling insects, particularly lepidopterans. The current sequence is that of the V5 antibody epitope/His tag purification peptide of the invention which was used to purify Paenibacillus sp. DAS1529 ORF7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Translation factor; suil; RPL14; CD39L3; PMGM; GC20; cancer; metastasis; carcinoma; non-small cell carcinoma; smoking; lung cancer;

This invention relates to a novel method for producing a soluble RNA polymerase protein. Specifically, it refers to an RNA polymerase enzyme isolated from the post-transcriptional gene silencing (PTGS) pathway that is useful for in vitro RNA synthesis kits. The present invention describes an enzyme with enhanced solubility capable of producing two types of reaction products i.e. both short and long RNA copies. Purthermore, template including template length complementary RNA copies of the require a primer for initiation of RNA synthesis. As such, this method can also be used to produce radioactively or chemically labelled RNA probes for in situ hybridisation analyses or microarray work, to generate ringer RNA molecules to induce RNA interference effects in vivo and in vitro or to study nucleic acid secondary structure, nucleic acid-protein interactions. This
smoker or former smoker) at risk for the development, recurrence, or metastasis of cancer (preferably cancer of lung, bladder, head, neck, urothelial, kidney, pancreas, mouth, throat, pharynx, larrynx or esophagus, or an upper airway primary or secondary cancer), to identify subjects who need an intensive follow-up protocol and for the prognosis and diagnosis of cancer. This is the amino acid sequence of the human translation factor homologue suil/GC20 (located on chromosome 3p21.3, see AAU76974) and fragments of the vector pCDNA3.1/GS into which it is cloned in order to develop the gene probe described in the method of the

The invention provides a mutant antibody comprising a reactive site that is not present in the wild-type of the antibody. The antibody also has a complementarity determining region (CDR) that specifically binds to a metal chelate against which the wild-type antibody is raised. The complementarity determining region (CDR) that specifically binds to a metal chelate against which the wild-type antibody is raised. The covalent bond. The present sequence is that of anti-indium-EDTA covalent bond. The present sequence is that of anti-indium-EDTA conduct-raided design was used to develop an indium-EDTA chelate to computer-aided design was used to develop an indium-EDTA chelate to computer-aided design was used to develop an indium-EDTA chelate to covalently bind to CHA255 in vivo. The premise was to allow the chelate to bind non-covalently to CHA255 bound to a tumour and then to covalently conducted the chelate to the antibody, thereby trapping it at the tumour site. This involved cloning the variable domains of CHA255 to construct a chuman/mouse chimeric Pab fragment that could be expressed in Bscherichia coll, and the synthesis and screening of benzyl-EDTA chelates carrying weakly electrophilic groups capable of conjugation of the antibody in vivo. This Pab can be conjugated to a targeting molety when desired. A reactive site was incorporated into the antibody by engineering a Cys residue at location Aban-96 or Ser-95 of the light chain, near the region of the antibody to which the chelate bound. Such engineering is typically accomplished by site-directed mutagenesis of a nucleic acid encoding the wild-type of the antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

This invention relates to multi-functional antibodies that recognise chelating agents and metal chelates, particularly macrocyclic metal chelate bend to an antigen recognition down to employ that comprises a metal chelate bound to an antigen recognition domain, where the metal chelate bas a reactive functional group of complementary reactivity to the reactive site of the antibody. This reactive site is the side chain of a naturally occurring amino acid e.g. the -SH group side chain of a cavalent bond between the reactive site of the antibody and the reactive functional group of the metal chelate. The present invention describes using these antibodies for in vivo imaging where the antibody of comprises a targeting moiety that binds specifically to a cell via a cell surface receptor or antigen thus forming a cell-mutant antibody complex. On addition of the metal chelate, a cell-antibody-metal chelate complex. On addition of the metal chelate, a cell-antibody-metal chelate complex. Seconance imaging, lanthanide luminescence, gamma-emissions or single photon emission tomography (SPET). As such, this method is useful for treating a subject with cancer and pharmaceutical compositions exhibit cytostatic and immunosuppressive activities. This polypeptide sequence is a chimeric mutine antibody 2D12.5 variable heavy chain protein fused to the human anti-tetanus toxin antibody CHI heavy chain constant region
                                                                                                                                                       vel mutant antibody comprising reactive site not present in wild-type antibody and antigen recognition domain that recognizes macrocyclic al chelate having four nitrogen atoms, useful for treating cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            with a V5 epitope and (His)6 tag, given in an exemplification of

This invention relates to multi-functional antibodies that recognise chelating agents and metal chelates, particularly macrocyclic metal chelates. Specifically, it refers to an antibody that comprises a metal chelate bound to an antigen recognition domain, where the metal chelate chas a reactive functional group of complementary reactivity to the reactive site of the antibody. This reactive site is the side chain of a caturally occurring amino acid e.g. the -SH group side chain of a cysteine residue (not present in the wild type) which can be used to form a covalent bond between the reactive site of the antibody and the creative functional group of the metal chelate. The present invention describes using these antibodies for in vivo imaging where the antibody comprises a targeting motety that binds specifically to a cell via a cell surface receptor or antigen thus forming a cell-mutant antibody complex. On addition of the metal chelate, a cell-mutant antibody complex is formed that can be detected using emission tomography, magnetic resonance imaging, lanthanide luminescence, gamma-emissions or single photon emission tomography (SPET). As such, this method is useful for treating a subject with cancer and pharmaceutical compositions exhibit cytostatic and immunosuppressive activities. This polypeptide is the cutant protein sequence comprising a chimeric murine antibody 2012.5 cratiable heavy chain protein fused to the human anti-tetanus toxin antibody continue and a V5 epitope with (His)6 tag, given in an exemplification companied on the continue and mutant region (2dVH-TTCH) with NB7D and G53C antibody chain protein fused to the human anti-tetanus dominance the continue companies and continue and a V5 epitope with (His)6 tag, given in an exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel mutant antibody comprising reactive site not present in wild-type

Treater bound to an antigen recognition domain, where the metal charact character bound to an antigen recognition domain, where the metal character reactive functional group of complementary reactivity to the reactive site of the antibody. This reactive site is the side chain of a naturally occurring amino acid e.g. the -SH group side chain of a cysteine residue (not present in the wild type) which can be used to form a covalent bond between the reactive site of the antibody and the carctive functional group of the metal chelate. The present invention describes using these antibodies for in vivo imaging where the antibody comprises a targeting molety that blads specifically to a cell via a cell surface receptor or antigen thus forming a cell-mutant antibody complex. On addition of the metal chelate, a cell-antibody-metal chelate complex is formed that can be detected using emission tomography, magnetic resonance imaging, lanthanide luminescence, gamma-emissions or single photon emission tomography (SPET). As such, this method is useful for treating a subject with cancer and pharmaceutical compositions exhibit cytostatic and immunosuppressive activities. This polypeptide is the mutant protein sequence comprising a chimeric murine antibody 2012.5 variable heavy chain protein fused to the human anti-tetamus toxin antibody CH1 heavy chain constant region (20MH-TTCH) with an N87D
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             chelating agents and metal chelates, particularly macrocyclic metal chelates. Specifically, it refers to an antibody that comprises a metal chelate bound to an antigen recognition domain, where the metal chelate

chelating agent rather of martial control and control metal chelates. Specifically, it refers to an antibody that comprises a metal chelate bound to an antigen recognition domain, where the metal chelate has a reactive functional group of complementary reactivity to the reactive site of the antibody. This reactive site is the side chain of a naturally occurring amino acid e.g. the -SH group side chain of a cysteine residue (not present in the wild type) which can be used to form a covalent bond between the reactive site of the antibody and the reactive functional group of the metal chelate. The present invention describes using these antibodies for in vivo imaging where the antibody surface receptor or antigen thus forming a cell-mutant antibody complex. On addition of the metal chelate is considered to make its forming a cell-mutant antibody complex is formed that can be detected using emission tomography, magnetic
Novel mutant antibody comprising reactive site not present in wild-type of antibody and antigen recognition domain that recognizes macrocyclic metal chelate having four nitrogen atoms, useful for treating cancer or

photon emission tomography (SPET). As such, this method is useful for treating a subject with cancer and pharmaceutical compositions exhibit cytostatic and immunosuppressive activities. This polypeptide is the mutant protein sequence comprising a chimeric murine antibody 2D12.5 variable heavy chain protein fused to the human anti-tetamus toxin antibody CHI heavy chain constant region (2dVH-TTCH) with NB7D and GS5C mutations and a VS epitope with (His)6 tag, given in an exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                Chimeric 2dVH-TTCH protein with tag and an N87D/G54C mutations SeqID 84.

```
This invention relates to multi-inncrional antibodies that recognise chelating agents and metal chelates, particularly macrocyclic metal chelates. Specifically, it refers to an antibody that comprises a metal chelates bound to an antigen recognition domain, where the metal chelate has a reactive functional group of complementary reactivity to the has a reactive functional group of complementary reactivity to the carctive site of the antibody. This reactive site is the side chain of a naturally occurring amino acid e.g. the -SH group side chain of a covalent bond between the reactive site of the antibody and the carctive functional group of the metal chelate. The present invention describes using these antibodies for in vivo imaging where the antibody complex. Or addition of the metal chelate, a cell-mutant antibody complex. Or addition of the metal chelate, a cell-mutant antibody complex. Or addition of the metal chelate, a cell-mutant antibody complex. Or addition of the metal chelate, a cell-mutant antibody magnetic cresonance imaging, lanthanide luminescence, gamma-emissions or single cresonance imaging, lanthanide luminescence, gamma-emissions or single creating a subject with cancer and pharmaceutical compositions exhibit cytostatic and immunosuppressive activities. This polypeptide is the mutant protein sequence comprising a chimeric mutine antibody 2D12.5 creatible heavy chain protein fused to the human anti-tetamus toxin antibody can have an antibody chain constant region (20MH-TCRI) with NBTD and G54C mutantible heavy chain constant region (20MH-TCRI) with man exemplification metals or mutantion and a V5 epitope with (His)6 tag, given in an exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chimeric murine 2D12.5 VH antibody fused to human TTCH protein with tag.

chelating agents and metal chelates, particularly macrocyclic metal chelating agents and metal chelates, particularly macrocyclic metal chelates Specifically, it refers to an antibody that comprises a metal chelate bound to an antigen recognition domain, where the metal chelate has a reactive functional group of complementary reactivity to the reactive site of the antibody. This reactive site is the side chain of a contained of contained amino acid e.g. the "SH group side chain of a cysteine residue (not present in the wild type) which can be used to form a covalent bond between the reactive site of the antibody and the reactive functional group of the metal chelate. The present invention chescribes using these antibodies for in vivo imaging where the antibody complex. Or surface receptor or antigen thus forming a cell-mutant antibody complex. On addition of the metal chelate, a cell-antibody—metal chelate complex. On addition of the metal chelate, a cell-antibody—metal chelate complex. CC resonance imaging, lanthanide luminescence, gamma-emissions or single photon emission tomography (SPET). As such, this method is useful for treating a subject with cancer and pharmaceutical compositions exhibit correction and immunospapers activities. This polypeptide sequence is a chimeric murine antibody 2D12.5 variable heavy chain protein fused to haven in an exemplification of the
                                                                           Novel mutant antibody comprising reactive site not present in wild-type of antibody and antigen recognition domain that recognizes macrocyclic metal chelate having four nitrogen atoms, useful for treating cancer or
                                                                                                                                                                                                                     invention relates to multi-functional antibodies that recognise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

This invention relates to a novel polypeptide having an amino acid
sequence that is different from and is at least about 70% identical to
the amino acid sequence of human receptor activator of NPKappaB (hRANK)
or human osteoprotegerin (hOPG), and which has a binding affinity to RANK
(ligand (RANKL) that is at least as high as the binding affinity of hRANK
or hOPG to RANKL, as determined by functional competition assay. The
protein of the invention may have osteopathic activity and may act as a
RANKL-mediated osteoclastogenesis or RANKL-mediated osteoclast activity
inhibitor. The nucleotide sequence shown in the invention may be used in
CG gene therapy. The protein of the invention or fusion proteins comprising
this protein are useful as a pharmaceutical, and in the preparation of a
CM medicament for treating or preventing osteoporosis, or other bone
can ediseases or diseases associated with binding of RANKL to the RANK
cerceptor. A host cell containing a vector expressing the protein is
cuseful for producing a polypeptide having binding affinity to RANKL,
where the polypeptide comprises at least one N- or O-glycosylation site
cand the host cell is a eukaryotic host cell capable of in vivo
cglycosylation, and/or the polypeptide is subjected to conjugation to a
cnon-polypeptide moisty in vitro. The protein of the invention has
conjugation and cell in vivo half-life and/or serum half-life comparated to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NRANK or hOPG and has an improved binding affinity to RANKL compared to the binding affinity of hRANK or hOPG to RANKL, as determined by a functional competition assay. The present sequence represents a soluble
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RANKL; human receptor activator of NFkappaB; osteoprotegerin; OPG; RANK ligand; osteoclastogenesis; osteoclast inhibitor; gene therapy; osteoporosis; bone disease; human; pYhRANKD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         numan OPG protein which is expressed on the surface of yeast cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            inhibitor. The nucleotide sequence shown in the invention may be used in gene therapy. The protein of the invention or fusion proteins comprising this protein are useful as a pharmaceutical, and in the preparation of a medicament for treating or preventing osteoporosis, or other bone diseases or diseases associated with binding of RANKL to the RANK receptor. A host cell containing a vector expressing the protein is useful for producing a polypeptide having binding affinity to RANKL, where the polypeptide comprises at least one N. or O-glycosylation site and the host cell is a enkaryotic host cell capable of in vivo glycosylation, and/or the polypeptide is subjected to conjugation to a con-polypeptide moietry in vitro. The protein of the invention has increased functional in vivo half-life and/or serum half-life compared to hRANK or hOPG and has an improved binding affinity to RANKL compared to the binding affinity of hRANK or hOPG to RANKL, as determined by a functional competition assay. The present sequence represents a human RANKL protein-HIS tag fusion protein encoded by the pyhRANKO expression vector used in teh method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequence that is different from and is at least about 70% identical to the amino acid sequence of human receptor activator of NFKappaB (hRANK) or human osteoprotegerin (hOPG), and which has a binding affinity to RANK ligand (RANKL) that is at least as high as the binding affinity of hRANK or hOPG to RANKL, as determined by functional competition assay. The protein of the invention may have osteopathic activity and may act as a RANKL-mediated osteoclast activity
                                                                                                                                                                                                                                                                                   Novel human receptor activator of NFkappaB (hRANK) or human osteoprotegerin (hOPG) variant polypeptides which bind to RANK ligand (RANKL) with equivalent binding affinity as hRANK or hOPG, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel polypeptide having an amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           65.0%; Score 58.5; DB 5; Length 349; 59.1%; Pred.                                                                                                                                                   The invention relates to a novel cell, comprising three heterologous conjugates (HC), a first HC (HC1) comprising an anchor protein that specifically binds to an internal structure within the cell conjugated to an interactor protein (IP) of type A, a second HC (HC2) comprising IP of type B conjugated to a first protein of interest, and a third HC (HC3) comprising a second protein of interest conjugated to detectable group. The cell is useful for detecting if a compound disrupts or induces the interaction between two intracellular proteins. The cell is also useful for screening compounds that modulate the interaction between two intracellular proteins. The present sequence is used in the
Novel cell for identifying modulators of protein interaction, contains a first conjugate comprising anchor protein, second conjugate having type B interactor protein and third conjugate with detectable group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             VEGF-X; vascular endothelial growth factor; human; vulnerary; cytostatic; antirheumatic; antiarthritic; antipsoriatic; antidiabetic; treatment; angiogenesis regularcy; vascularization regulator; cancer; psoriasis; rheumatoid arthritis; diabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue reppir; wound; dermal ulcer; pressure sore; venous sore; diabetic ulcer; burns; skin graft growth.

This invention describes a novel vascular endothelial growth factor-X

(VEGF-X) protein (Ia) and its encoding polymuclecide (IIa) which has

vulnerary, cytostatic, antirheumatic, antiarthritic, antipaoriatic and

antidiabetic activity and acts as an angiogenesis and vascularization

capilator. An antisense molecule of the invention is useful for treating

cor preventing cancer, rheumatoid arthritis, psoriasis and diabetic

cor preventing cancer, rheumatoid arthritis, psoriasis and diabetic

cor preventing cancer, rheumatoid arthritis, psoriasis and diabetic

cor preventing cancer, rheumatoid arthritis, psoriasis and diabetic

vascularization including formation and proliferation of new blood

cor preparing medicaments for treating wounds such as dermal ulcers,

pressure sores, venous sores, diabetic ulcers and burns and to promote

skin graft growth, tissue repair, proliferation of new blood vessels,

tissue regeneration and organ repair by promoting angiogenic activity or

vascularization. This sequence represents a human VEGF-X protein which

can be expressed in mammalian systems and which is described in the

method of the invention
                                                                                                                                                                                                                               preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds.
                                                                                                                                                                                                       New vascular endothelial growth factor protein, useful for treating or

The invention relates to polynucleotides that control delta-6 desaturase genes (D6D) and methods useful for identifying compounds which inhibit or promote the activity of mammalian D6D. Compounds which modulate D6D gene segments are useful for treating lipid metabolism disorders e.g. atopic eczema, mastalgia, rheumatoid arthritis, Sjogren's syndrome, cardiorders, viral infections and post viral fatigue, premenstrual syndrome, endometriosis, cystic fibrosis, alcoholism, alzheimer's syndrome, cardiovascular disease, Crohn's disease, cancer, congenital liver disease, schizophrenia, diabetes and diabetic complications including diabetic neuropathy, nephropathy and retinopathy. Compounds of the invention are also useful for inhibiting progressive and autoimmune disorders, hypercholesterolaemia and other atopic disorders. D6D genes are useful in gene therapy. The present sequence is C-terminal tagged rat delta-6-desaturase (rD6D-1) enzyme
                                                                                                                                                                                                                                                     Nucleic acid encoding delta-6-desaturase gene useful for treating atopic eczema, mastalgia, rheumatoid arthritis, Sjogren's syndrome, gastrointestinal disorders, viral infections and post viral fatigue.

US-09-021-287-3
Sequence 3, Application US/09021287
Sequence 3, Application US/09021287
Patent No. 5981717
GENERAL INFORMATION:
APPLICANT: Greenspan, Daniel S
APPLICANT: Takahara, Kazuhiko
APPLICANT: Hoffman, Guy G
TITLE OF INVENTION: Mammalian Tolloid-Like Protein
NUMBER OF SEQUENCES: 13
CORRESPONDENCE ADDRESS:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/866,650
FILING DATE:
CLASSIFICATION: 514
ATTORNEY/AGENT INFORMATION:
NAME: Benson, Bennett J
REGISTRATION NUMBER: 37094
REFERENCE/DOCKET NUMBER: 960296.93839
TELECOMMUNICATION INFORMATION:
TELEPHONE: 608-251-500
TELEPAX: 608-251-9166
INFORMATION FOR SQ ID NO: 3:
SEQUENCE CHARACTERISTICS:
LENGTH: 1013 amino acids
TYPE: amino acid
TYPE: amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  COUNTRY: US

May track DNA in a ATP-dependent manner by generating positive supercoils in front of it and negative supercoils behind it (By similarity).

MISCELLANEGUS: Although strongly related to firsk, it lacks the typical transmembrane domains located at the N-terminal part of

"A revised sequence of the rat c/6bp gene.";
Genes Dev. 8:1131-1132(1994).
-!- FUNCTION: C/EBP is a DNA-binding protein that recognizes two different motifs: the CCAAT homology common to many promoters and the enhanced core homology common to many enhancers.
-!- SUBUNIT: Binds DNA as a dimer and can form stable heterodimers with C/EBP beta and gamma.
-!- SUBCELIULAR LOCATION: Nuclear.
-!- SIMILARITY: Belongs to the bZIP family. C/EBP subfamily.
                                                                                                                                                                                                                                                                                Rattus norvegicus (Rat).
